CIRCUIT DESCRIPTION

Outline

The TM-733A/E are 144/430MHz FM dual band car transceivers designed for armature radio communications.

• Features

1. The current operating state can be stored in six programmable memory channels.
2. Complete compact dual band function.
3. The extended cable kit (option) can be used to disconnect the panel with one touch of a finger. Free setting is made possible.
4. Independent receiving function enables the simultaneous receiving of 144MHz and 430MHz bands. (Both bands independent, full display, volume, squelch, signaling, external loudspeaker.)
5. Large LCD (97.0 x 19.0 mm).
6. Simple operation like monoband type.
7. Both 144MHz and 430MHz bands can be received at a time.
8. Duplexer built in (Types K and P excluded).
9. S-meter squelch function built in. Switching to noise squelch provides the adjustment of S-meter squelch level with a squelch volume.
10. With a maximum of 70 memory channels, the switching of a memory channel mode permits the number of memory channels for each band to be changed. (All channels in full split memory)
11. DTSS and paging functions built in.
12. Wireless (DTMF) coulomb function built in.
13. Equipped with packet communication connector.

CIRCUIT DESCRIPTION

TM-733A/E

Frequency Configuration

The TM-733A/E has separate PLL and IF units for the VHF and UHF bands, so it can receive signals on both bands at the same time. It has a VHF sub-receiver to receive a UHF signal in the VHF band and a UHF sub-receiver to receive the VHF band signal in the UHF band.

The 144MHz band receiver mixes the received signal with the first local oscillation frequency of 163.05 to 219.045MHz (K,P), 189.05 to 191.045MHz (M,E) to produce the first intermediate frequency of 45.05MHz. The signal is then mixed with the second local oscillation frequency of 45.505MHz to produce the second intermediate frequency of 455kHz.

The 430MHz band receiver mixes the received signal with the first local oscillation frequency of 351.475 to 411.47MHz (K,P), 371.475 to 381.47MHz (M,E) to produce the first intermediate frequency of 58.525MHz. The signal is then mixed with the second local oscillation frequency of 58.0MHz to produce the second intermediate frequency of 455kHz.

The 144MHz band sub-receiver mixes the received signal with the first local oscillation frequency of 118.525 to 232.52MHz (K,P), 202.525 to 206.52MHz (M), 202.525 to 204.52 MHz (E) to produce the first intermediate frequency of 58.525MHz. The signal then goes to the second intermediate frequency section of the UHF receiver to produce the second intermediate frequency of 455kHz.

The 430MHz band sub-receiver mixes the received signal with the first local oscillation frequency of 364.95 to 424.945MHz (K,P), 384.95 to 394.945MHz (M,E) to produce the first intermediate frequency of 45.05MHz. The signal then goes to the second intermediate frequency section of the VHF receiver to produce the second intermediate frequency of 455kHz.

The receivers and sub-receivers for the 144 and, 430MHz bands all use double conversion. The transmitter contains a PLL circuit that directly generates and divides down carriers for both bands. The transmission signals are amplified by a linear amplifier and transmitted. The main circuits are used to transmit signals even if a sub-band is being used.

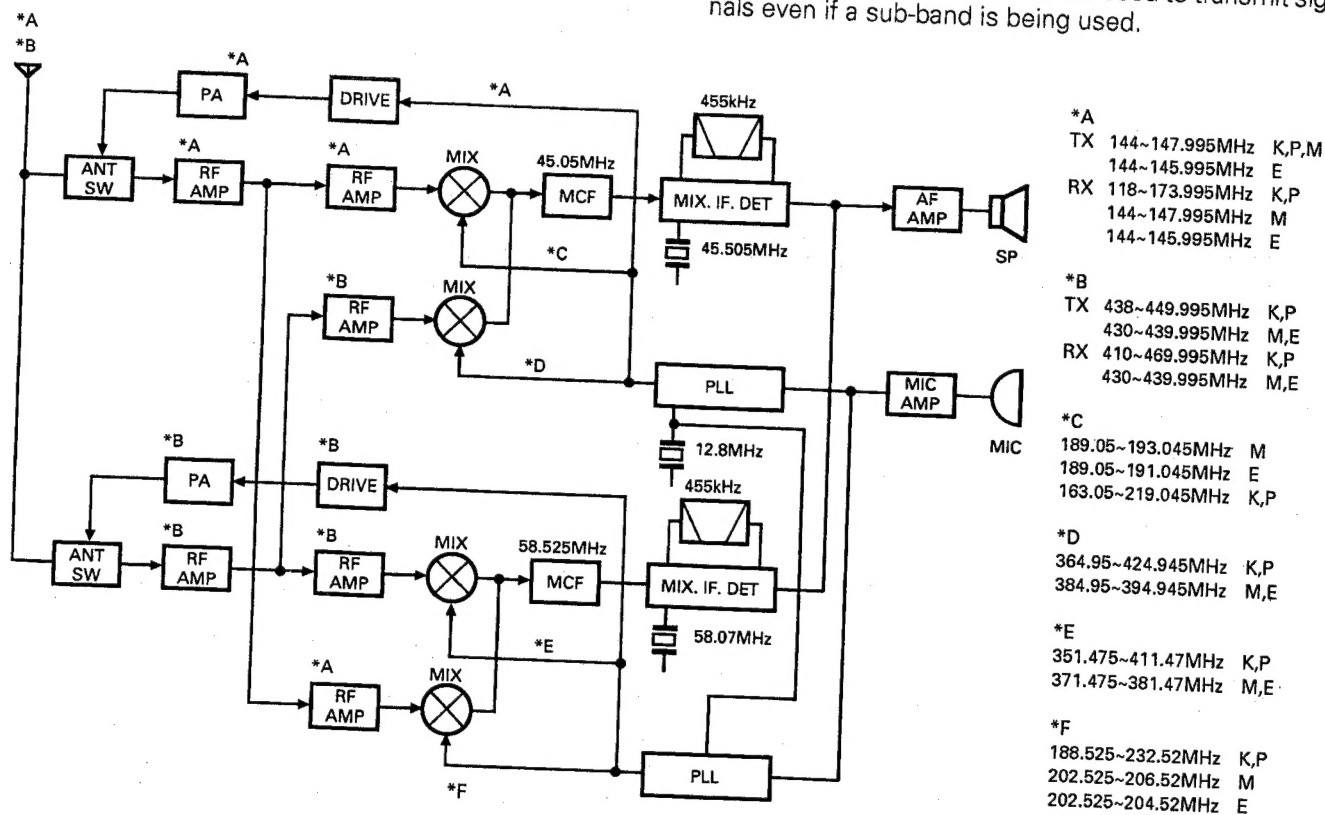

Fig.1 Frequency configuration

TM-733A/E

CIRCUIT DESCRIPTION

144MHz Band Transmit Circuit

- **Outline**

The transmit circuit produces the desired carrier frequency directly, and directly modulates its frequency by means of a vari-cap diode.

- **Modulator circuit**

The audio signal amplified and limited by the control unit passes through a splatter filter, is mixed with the sub-tone from the microcomputer, and input to PLL unit HIC IC9. The PLL unit directly modulates the carrier frequency with the input audio signal by using a vari-cap diode to control the frequency of the VCO.

- **Younger-stage circuit**

The signal output from the PLL unit goes to drive circuit HIC IC10 (KCB11). The HIC can provide a stable drive output for the final module without adjustment because it has a large bandwidth.

- **Power amplifier circuit**

The drive signal input to the power module according to the output power is amplified to the specified level.

- **APC and power switching circuits**

The automatic transmission output control circuit (APC) detects and partially amplifies the transmission output with a diode, and controls the DB voltage for the drive stage and final module to keep the transmit output constant. The power switching circuit can switch the power by changing the setting resistor for the APC control voltage with a signal from the shift register (IC8).

430MHz Band Transmit Circuit

- **Outline**

The transmit circuit produces the desired carrier frequency directly and directly modulates its frequency by means of a vari-cap diode.

- **Modulator circuit**

The audio signal amplified and limited by the control unit passes through a splatter filter, is mixed with the sub-tone from the microcomputer, and input to PLL unit (KCH20) IC207. The PLL unit directly modulates the carrier frequency with the input audio signal by using a vari-cap diode to control the frequency of the VCO.

- **Younger stage circuit**

The signal output from the PLL unit goes to drive circuit HIC IC209. The HIC can provide stable drive output for the final module without adjustment because it has a large bandwidth.

- **Power amplifier circuit**

The drive signal input to the power module according to the output power is amplified to the specified level.

- **APC and power-switching circuits**

The automatic transmission output control circuit (APC) detects and partially amplifies the transmission output with a diode, and controls the DB voltage for the drive stage and final module to keep the transmit output constant. The power switching circuit can switch the power by changing the setting resistor for the APC control voltage with a signal from the shift register (IC206). To protect the high power model from excessive temperature rise, there is a thermal switch to reduce the power automatically if the temperature reaches a certain level.

CIRCUIT DESCRIPTION

144MHz Band Receive Circuit

The received 144MHz band signal from the antenna passes through a transmission/reception selection diode switch. The signal then passes through an antenna matching coil in the receiver front end and a divider, and is amplified by a joint type field-effect transistor. The unwanted components of the signal are eliminated by a band-pass filter consisting of a three stage variable capacitor. The resulting signal goes to the first mixer, is mixed with the first local oscillator signal from the PLL circuit, and so converted to the first intermediate frequency of 45.05MHz. The unwanted near by signal components are eliminated by a two stage MCF.

The first intermediate frequency signal is amplified and input to FM IF HIC IC1 (KCD04). This signal is then mixed with the second local oscillation frequency of 45.505MHz to produce the second intermediate frequency signal of 455kHz. The unwanted near by signal components are eliminated by an FM ceramic filter. The resulting signal is input to IC1 again, amplified, and detected to produce an audio signal.

• Signal strength meter

The signal strength meter output voltage of FM IF HIC IC1 (KCD04) is input to the control unit. It is then digitized to drive the bar meter of the LCD.

Item	Rating
Center frequency	45.050MHz
Pass bandwidth	$\pm 7.5\text{kHz}$ or more at 3dB
Attenuation bandwidth	$\pm 22\text{kHz}$ or less at 25dB
Guaranteed attenuation	80dB or more within Fo - (890~930kHz) (Spurious : 40dB or more within $\pm 1\text{MHz}$)
Ripple	1dB or less
Insertion loss	3dB or less
Terminating impedance	$800\Omega \pm 10\%$, $2\text{pF} \pm 10\%$

Table 1 MCF (L71-0443-05) (TX-RX unit XF1)

430MHz Band Receive Circuit

The incoming 430MHz band signal from the antenna passes through a transmission/reception selection diode switch in the final unit and a matching coil in the front end. The signal is amplified by a GaAs field-effect transistor (FET) and passes through a divider and a two-pole dielectric filter to eliminate unwanted signal components. The resulting signal is amplified by a GaAs FET, passes through a two-pole dielectric filter, and goes to the first mixer, is mixed with the first local oscillator signal from the PLL circuit, and so converted to the first intermediate frequency of 58.525MHz. The unwanted near-by signal components are eliminated by a two stage MCF. The first intermediate frequency signal is amplified and input to FM IF HIC IC201 (KCD04). This signal is then mixed with the second local oscillation frequency of 58.07MHz to produce the second intermediate frequency signal of 455kHz. The unwanted near by signal components are eliminated by a ceramic filter. The resulting signal is amplified, and detected to produce an audio signal.

• Signal-strength meter

The signal strength meter output voltage of FM IF HIC IC201 (KCD04) is input to the control unit micro-computer to drive the signal strength meter.

Item	Rating
Center frequency	58.525MHz
Pass bandwidth	$\pm 8.5\text{kHz}$ or more at 3dB
Attenuation bandwidth	$\pm 23\text{kHz}$ or less at 25dB $\pm 60\text{kHz}$ or less at 60dB
Guaranteed attenuation	80dB or more within $\pm 1000\text{kHz}$ (Spurious : 40dB or more within $\pm 1\text{MHz}$)

TM-733A/E

CIRCUIT DESCRIPTION

144MHz Band Sub Receive Circuit

The received signal from the antenna goes to the receiver front end for the 144MHz main band. The signal is amplified by a GaAs (gallium arsenide) field-effect transistor (Q1), input to the main 144MHz main circuit and sub circuit by the divider circuit, and input to the 430MHz band sub circuit. The unwanted signal components are eliminated by the filter circuit of the sub-receive circuit, and the resulting signal is amplified by

transistor Q211. The unwanted signal components are further eliminated by another filter circuit. The resulting signal is then mixed with the first local oscillator frequency by the FET (Q212) mixer to produce the first intermediate frequency signal of 58.525MHz. The signal is input to the 430MHz band main circuit, and the 144MHz sub band signal is received by the main circuit.

Fig. 2 144MHz band sub receive circuit block diagram

430MHz Band Sub Receive Circuit

The 144MHz unit can receive 430MHz band signals. The received signal from the antenna passes through a transmission/reception selection diode switch in the final section of the 430MHz unit. The signal then passes through an antenna matching coil, and is amplified by a GaAs (gallium arsenide) field-effect transistor (Q201). The amplified receive signal passes through a divider, and is amplified by IC3 (high frequency wide-band am-

plifier) of the 144MHz unit. The unwanted signal components are removed by a band-pass filter. The resulting signal goes to the first mixer, is mixed with the first local oscillator signal from the PLL circuit, and so converted to the first intermediate frequency of 45.05MHz. The subsequent receive operation is the same as for the 144MHz band.

Fig. 3 430MHz band sub receive circuit block diagram

CIRCUIT DESCRIPTION

Squelch Circuit

The panel unit microprocessor reads the angle of rotation of the squelch VR, and converts it to a 6 bit digital value. The panel unit microprocessor transfers the data to the control unit microprocessor, which in turn transfers the data to IC5 (IC205) : XRU4094BF.

The data is converted to analog by analog switch IC4 (IC204) : XRU4066BF according to the output from IC5 (IC205).

The ICs in parentheses are used in the 430MHz band unit.

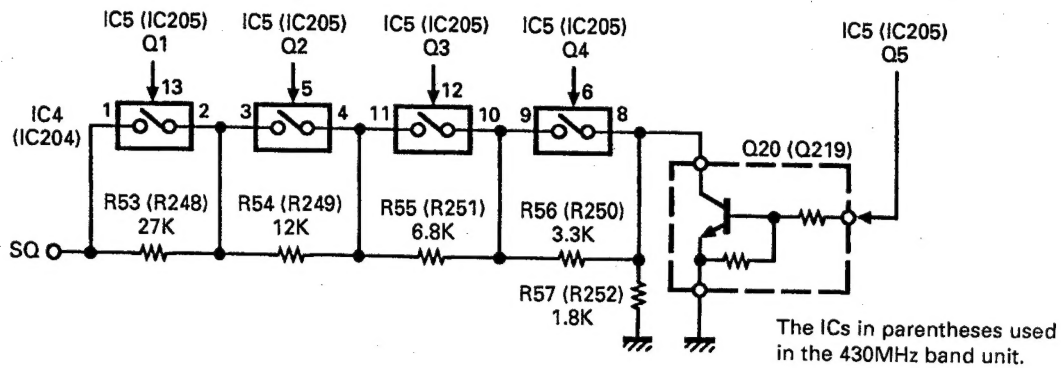

Fig. 4 Squelch circuit

144MHz Band Shift Register Circuit

The ESV1, ESV2, CKV, and DTV serial data from the control unit is sent to IC5, 8 (XRU4094BF) to perform the control operations outlined in the following table.

• IC5 control

Pin No.	Name	Function

144MHz Band 8T/8R Switching Circuit and Unlock Circuit

A high signal is applied to the base of Q15 and Q19 from the shift register during reception, Q16 is turned on, 8R is output, and Q18 and Q17 are turned off. 8T is not output. 8R is turned off, and 8T is turned on during transmission. The unlock signal is input to Q19 from the PLL unit. When the PLL is unlocked, this signal goes high. So, 8T is not turned on, and transmission does not occur even if a signal arrives from the shift register.

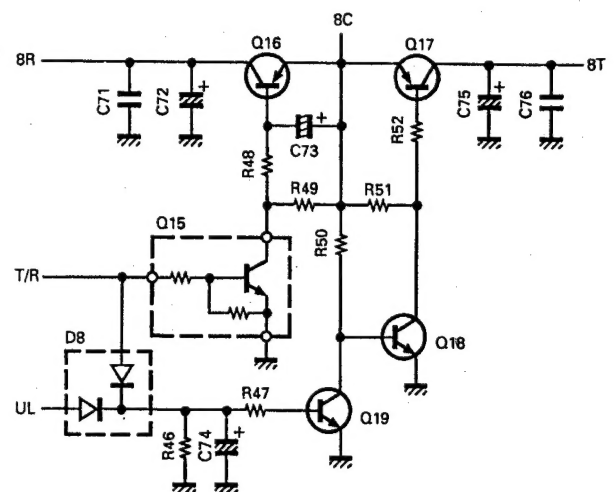

Fig. 5 144MHz band 8T/8R switching circuit and unlock circuit

A high signal is applied to the base of Q215 and Q214 from the shift register during reception, Q216 is turned on, 8R is output, and Q217 and Q218 are turned off. 8T is not output. 8R is turned off, and 8T is turned on during transmission. The unlock signal is input to Q214 from the PLL unit. When the PLL is unlocked, this signal goes high. So, 8T is not turned on, and transmission does not occur even if a signal arrives from the shift register.

Fig. 6 430MHz band 8T/8R switching circuit and unlock circuit

AF Signal System

- **Outline**

Detection signals RAV and RAU from the 144MHz and 430MHz units go to the mute and beep circuits of the control unit. The signals pass through the electronic VR, analog signal switching circuit, and speaker switching circuit of the 144MHz unit, and are output to the power amplifier and speaker.

- **Beep and mute circuits**

To sound the beep when a key is pressed, a pulse is output from P20 of the CPU, mixed with the output through the buffer (Q403) of monitor IC402 (DTMF encoder) for DTSS operation, passed through the beep mute circuit (Q404 and Q405) for each band, mixed with the detection signal for each band, and sent to the electronic VR. The audio mute circuit (Q409 and Q410) for each band works only when the beep sound is output from the CPU.

The signal output from the electronic VR passes through analog switch IC404 and the audio mute circuit (Q411 and Q412), and is output to the speaker switching circuit. The CPU transfers data to the electronic volume in the same way as for the TM-942.

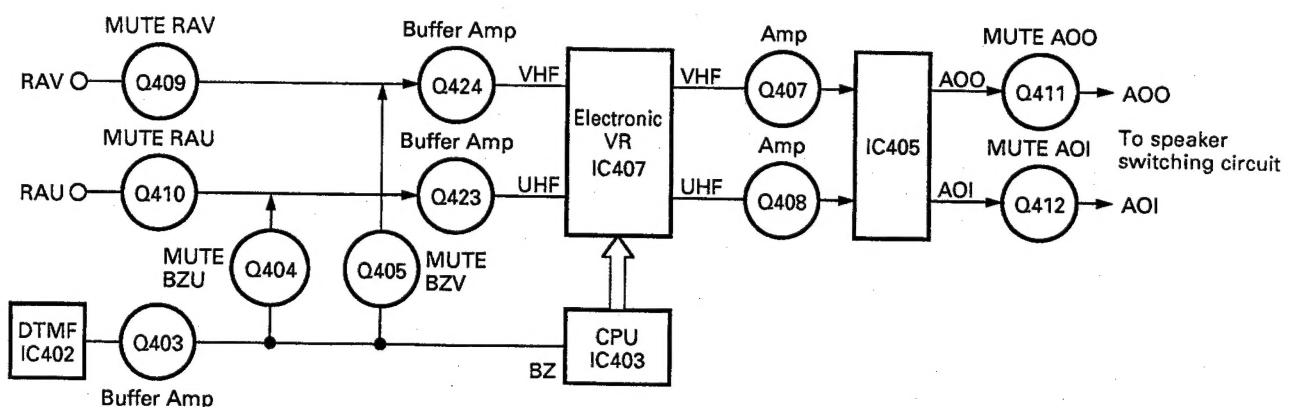

Fig. 7 AF signal system block diagram

CIRCUIT DESCRIPTION

Digital Control Unit

• Outline

The digital control unit controls functions with a single microprocessor (CPU). It consists of the tone output circuit, DTMF encode/decode circuit, electronic VR circuit, and analog signal switching circuit.

It contains the reset and backup circuits, microphone amplifier circuit, and microphone key input circuit.

Speaker switching circuit

The 144MHz unit has two speaker jacks, J1 and J2. AF signals can be output to various combinations of speakers, including the internal speaker.

If no external speaker is connected to J1, pins 10 and 11 of IC7 go low, and AF signals AOO and AOI from the control unit are added. The resulting signal goes to power amplifier IC6.

If an external speaker is connected to J1, pins 10 and 11 of IC7 go high, and AOO and AOI are input to IC6 separately.

Combinations of AF signals are listed below.

	AOO	AOI
Internal speaker only	Internal speaker	
External speaker (J2)	External speaker	
External speaker (J1)	Internal speaker	External speaker
Internal speakers (2)	External speaker	Internal speaker

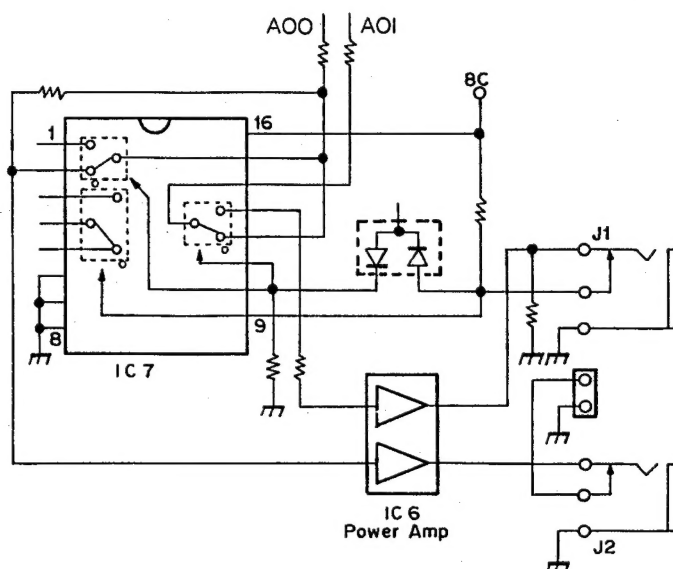

Fig. 8 Speaker switching circuit

Data Communication Circuit in the Panel Control Unit

Figure 9 shows the data communication circuit in the panel control unit. SO is serial data out and SI is serial data in. There is an inverter between them to protect the microprocessor ports.

Data communication is based on start-stop synchronization, and the transmission speed is 31250 bps. The microcomputer in the control unit checks connection every half second. If the check fails twice or the panel section is disconnected for more than one second, the power is turned off.

Fig. 9 Data communication circuit in the panel control unit

TM-733A/E

CIRCUIT DESCRIPTION

Tone Output Circuit

The signal is input to CP401 (ladder resistor) from P41 to P43, and P50 to P53 of the CPU, and converted from digital to analog to produce 38 signals of 67.0 to 250.3Hz. Figure 10 shows the internal configuration of CP401.

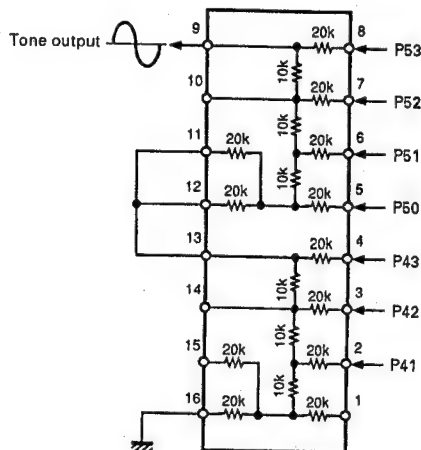

Fig. 10 Internal configuration of CP401

DTMF Encode/Decode Circuit

• DTMF encode/decode circuit

Data is transmitted to IC402 (TC35219F) from P90 to P93, and P72 to P73 of the CPU, and a DTMF signal is output from IC402.

• DTMF decode circuit

When the received signal or a signal from the DTMF microphone (option) enters IC401 (LC7387M) and an effective tone pair is detected, STD goes high, is input to P12 of the CPU, and serial data from IC401 is read into P61 according to the serial clock from P22.

Fig. 11 DTMF encode/decode circuit

Analog Signal Switching Circuit

IC405 switches the audio signal and DTMF decoder input MIC/RD, and IC406 switches between RDV and RDU of MIC, DTMF, and CTCSS.

• Audio signal switching

Switches the VHF AF signal and UHF AF signal from the electronic VR to AOI or AOO.

• DTMF MIC/RD switching

Switches the DTMF decoder IC input to the DTMF signal in the detection signal or the DTMF signal from the microphone.

• MIC RD V/U switching

Switches the signal output from microphone pin RD to RDV or RDU.

• DTMF RD V/U switching

Switches the input signal to the DTMF decoder IC to RDV or RDU. The signal passes through this circuit and the DTMF MIC/RD switching circuit, and goes to the DTMF decoder IC.

The signal is switched to RDV or RDU when a busy sense signal (SC) enters the CPU and DTSS and PAG are on for the band. If busy sense signals enter the CPU for both bands at the same time, the last detected band is used.

• CTCSS RD V/U switching

Switches the signal to the CTCSS unit (TSU-8 option) to RDV or RDU. The signal is switched to RDV or RDU when a busy sense signal (SC) enters the CPU and CTCSS is on for the band. If busy sense signals enter the CPU for both bands, the circuit is switched in 500msec intervals.

P101 (Audio signal switching)	H : AOO=VHF AF, AOI=UHF AF L : AOO=UHF AF, AOI=VHF AF
P100 (DTMF MIC/RD switching)	H : DTMF signal in the detection signal L : DTMF signal from microphone
P110 (MIC RD V/U switching)	H : RDV L : RDU

CIRCUIT DESCRIPTION

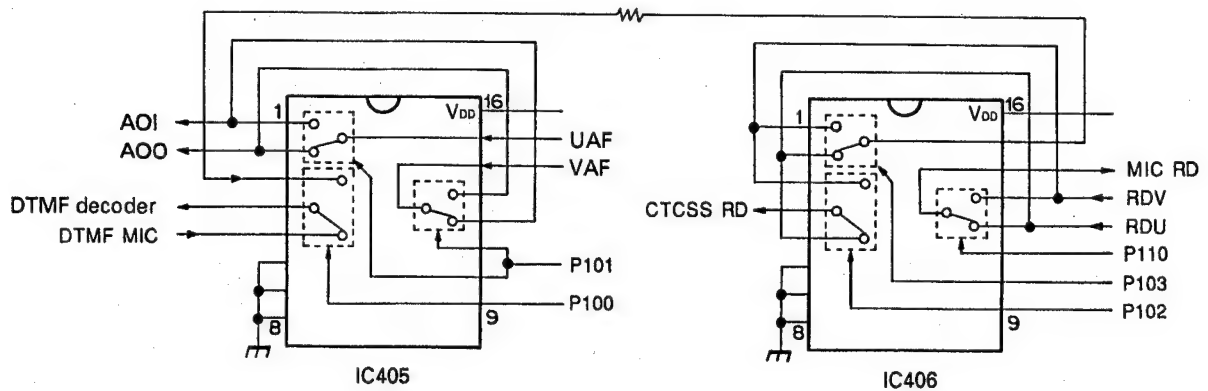

Fig. 12 Analog signal switching circuit

DATA Connector and Peripheral Circuits

The data communication connector (J402) is on the front panel to control transmission, data input/output, and squelch signals. There are two data communication modes: 9600 bps mode and conventional 1200 bps mode.

The 9600 bps mode is mainly used for 9600 bps GMSK and G3RUH packet communication. Unlike general 1200 bps AFSK, this high-speed modulation system effects frequency modulation by passing digital base band signals (square waves) through a filter for bandwidth limiting. This signal is similar to a digitally modulated 4800Hz signal (nearly sine wave because it is passed through a filter) in 9600 bps GMSK mode, and sounds like noise. There are GMSK and G3RUH systems according to the type of bandwidth limiting filter.

• Transmit signals

The transmission modulation signal enters through PKD. The path to the modulator when 9600 bps mode is on is different from that when it is off. The path when the DATA connector PKS is low is different from the path when PTT is low. Figure 13 lists paths ①, ②, and ③, and table 4 lists modulation input levels.

When 9600 bps mode is on, the frequency deviation changes according to the input signal level. A protection circuit is provided to inhibit transmission when the level reaches 4Vp-p.

The input PKD signal is partially detected by D411, and smoothed by C470 and R528. If the signal level reaches 4Vp-p, Q420 turns on and the Q422 output goes low. At the same time, the PKD signal connected to MO by IC411 is disconnected, Q421 turns off, and the PTT control signal goes high to stop transmission. PKS transmission is inhibited if the input reaches 4Vp-p.

Pin No.	Pin name	Specification	
		bps selection	
1	PKD	1200 bps	9600 bps
		Modulation input	40mVp-p
		Frequency deviation	3±0.5kHz
4	PR9	Output level : 500mVp-p/10kΩ Always input during reception	
5	PR1	Output level : 300mVp-p/10kΩ Not output if squelch is closed.	

Table 4 DATA connector input/output level

• Receive signal

PR9 is a receive output for high-speed data communication (9600 bps), and the FM detection circuit output (DET signal) is output through the Q402 buffer amplifier. This signal is always output regardless of whether the squelch is open or closed.

PR1 is a receive output for general communication (1200 bps), and like PR9, the FM detection circuit output (DET signal) is output through the Q418 buffer amplifier. PR1 is squelch-controlled by IC404.

CIRCUIT DESCRIPTION

• Squelch signal output circuit

The squelch signal is input to TNC to prevent collision during packet communication. It is a digital transistor output pulled up by 5V and has the logic shown on the right.

SQC pin output (J402 pin 6)	Low: SQ close
	High: SQ busy

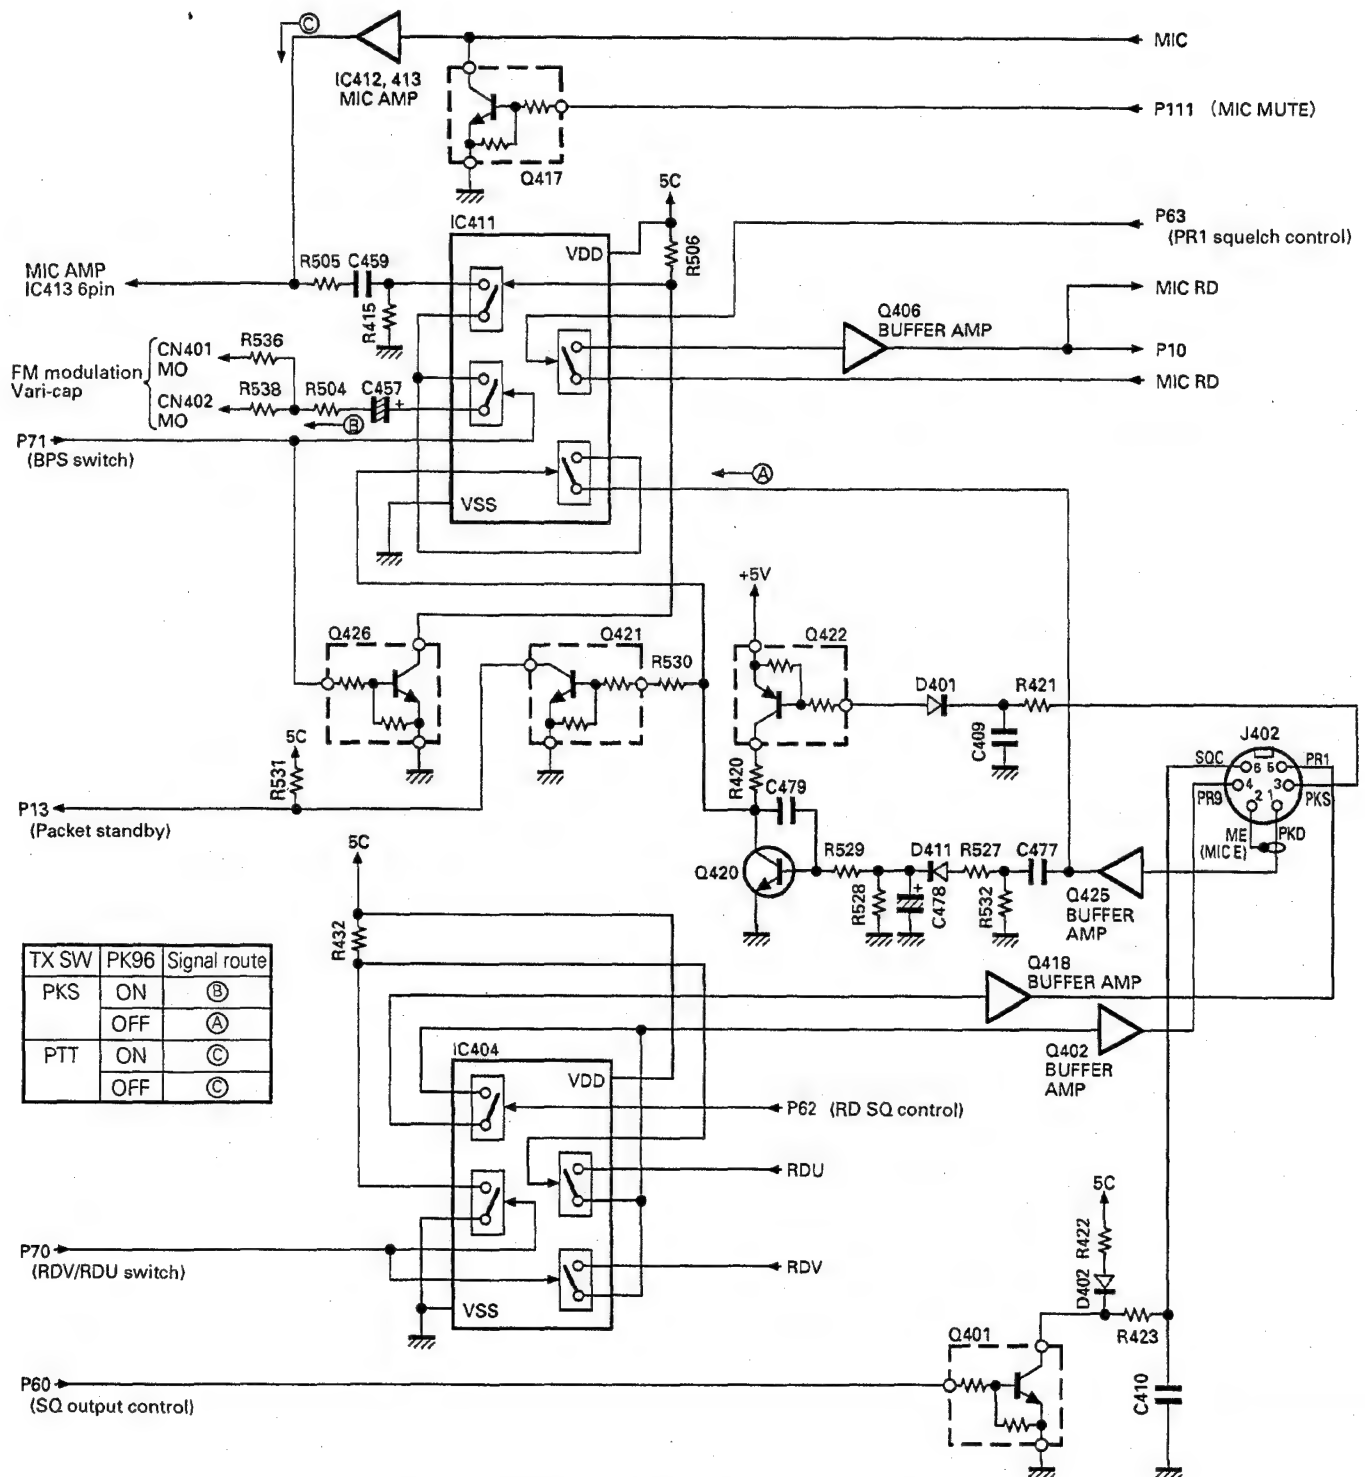

Fig. 13 DATA connector and peripheral circuits

CIRCUIT DESCRIPTION

Reset and Backup Circuits

When the power supply is disconnected, the voltage drop of the 13.8V line is detected, and INT4 of the CPU goes high. The CPU enters the backup mode.

When the power supply is disconnected and the voltage drop of the 5V line is detected, BA1 (lithium battery), which has been charged through D19,

discharges to provide backup power for the CPU through D18.

When the power supply is connected, a low level pulse of about 3msec duration is output by the reset circuit. This pulse goes to RESET of the CPU for power-on reset.

Fig. 14 Reset and backup circuits

Microphone Amplifier Circuit

The audio signal from the microphone goes to three operational amplifiers. These amplifiers constitute a pre-emphasis circuit, amplifier, limiter, and splatter circuit that eliminates unwanted high frequency components.

The modulator circuit directly modulates the frequency of the VCO for both the 144 and 430MHz bands by means of a vari-cap diode.

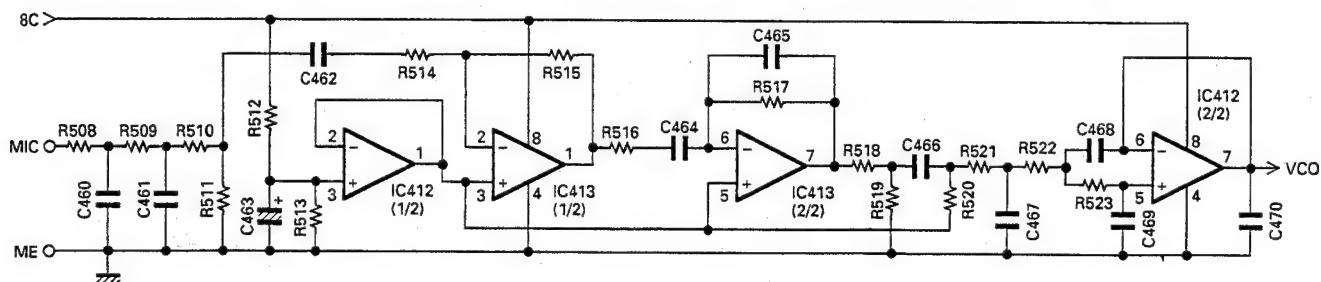

Fig. 15 Microphone amplifier circuit

CIRCUIT DESCRIPTION

Microphone Key Input

The microphone UP, DOWN, and function keys are connected to the analog input of the CPU, and each function is activated according to the voltage applied when a key is pressed.

Fig. 16 Microphone key input

Panel Unit (LCD Assy)

(B38-0708-25 : M4 type)

B38-0709-25 : Except M4 type)

• Outline

The panel unit has a microcomputer to control serial communication with the control unit of the main unit, the display circuit, memory, and dimmer circuit. The keys and key rotary encoder input signals directly to the microcomputer.

Dimmer Circuit

The dimmer circuit can change the brightness of the lamp in four steps, and turn the lamp off. Q3 amplifies the error of the stabilized power supply using a 5V reference voltage. The output voltage can be controlled in four steps by grounding a combination of the BP2 and BP3 ports of the microprocessor. If the impedance of BP1, connected to the emitter of Q2, is made high, Q2 is turned off. No lamp voltage is output, and the lamp goes off.

Fig. 17 Dimmer circuit

Reset Circuit

When the power supply is connected, the IC1 (L78LR05B-FA) output (pin 5) becomes 5V, and after about 100msec, RESET (pin 4) goes high. The signal is input to the RESET pin of the CPU (IC4) to reset it.

Key and Rotary Encoder Input Circuit

Each panel key signal is input from its own port. The VFO, and PM keys are pulled up by external resistors (the PSW key is pulled down), and the other keys are pulled up by software. The rotary encoder inputs signals directly to the microcomputer.

TM-733A/E

CIRCUIT DESCRIPTION

Display Circuit

The display circuit consists of the microcomputer, LCD driver and peripheral circuits, and LCD. The LCD is driven dynamically with a half-duty cycle. Part of the display is controlled by the driver (IC4) in the microcomputer, and part is controlled by the LCD driver (IC6 and IC7), as shown in Figure 18. Data is transferred serially to the LCD driver from P40 to P43 of the microcomputer.

Memory

Memory channel data is stored in IC5 (non-volatile memory). Data is written and read as serial data through P31 and P32.

Fig. 18 Display LCD (Except M4 type)

144MHz Band PLL Synthesizer

The VCO and PLL circuits comprise a hybrid integrated circuit housed in a solid shielded case. X2 (12.8MHz) is generated by the PLL IC (M56760FP) in the HIC, and is divided to produce a 5 or 6.25kHz reference frequency. Part of the 12.8MHz output is passed through the buffer amplifier, and goes to the 430MHz unit.

Comparison frequencies are produced by dividing X2 to correspond to the 5, 10, 15, 20, 12.5, and 25kHz

channel steps. When VHF band signals are received, 163.05 to 219.045MHz (K,P), 189.05 to 193.045MHz (M), 189.05 to 191.045MHz (E) is generated, and when VHF band signals are transmitted, 144.00 to 147.995MHz (K,P,M), 144.00 to 145.995MHz (E) is generated. When UHF sub band signals are received, a lock is established at twice the VCO oscillation frequency to produce 364.95 to 424.945MHz (K,P), 384.95 to 394.945MHz (M,E).

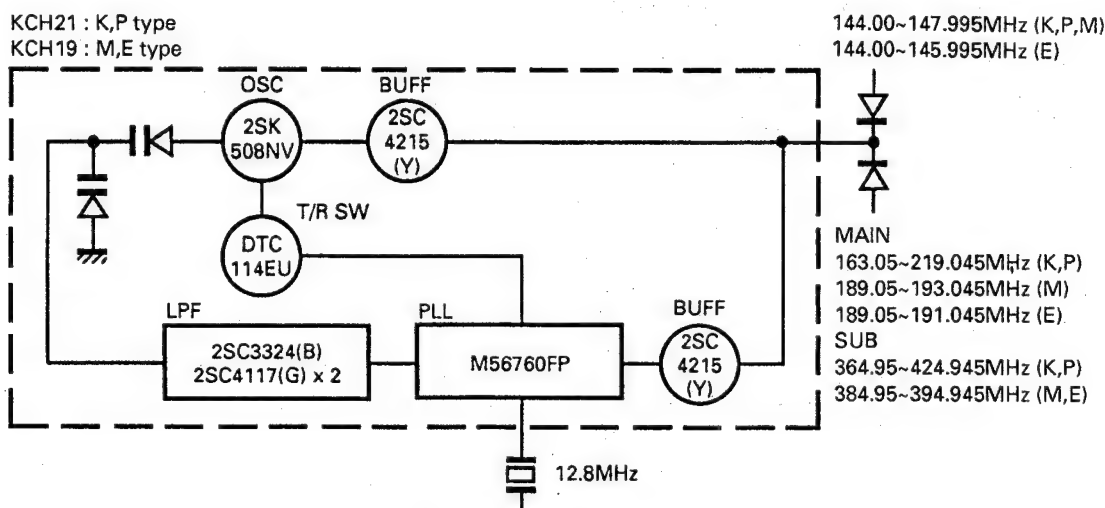

Fig. 19 144MHz band PLL block diagram

CIRCUIT DESCRIPTION

430MHz Band PLL Synthesizer

The VCO and PLL circuits comprise a hybrid integrated circuit housed in a solid shielded case. Comparison frequencies are produced by dividing a 12.8MHz reference frequency from the 144MHz band unit to correspond to the 5, 10, 15, 20, 12.5, and 25kHz channel steps:

When UHF band signals are received, 351.475 to 411.47MHz (K,P), 371.475 to 381.47MHz (M,E) is

generated, and when UHF-band signals are transmitted, 438.00 to 449.995MHz (K,P), 430.00 to 439.995MHz (M,E) is generated. When sub-VHF-band signals are received, the main VCO in the PLL unit stops and the sub-VCO for VHF operates to produce 188.525 to 232.52MHz (K,P), 202.525 to 206.52MHz (M), 202.525 to 204.52MHz (E).

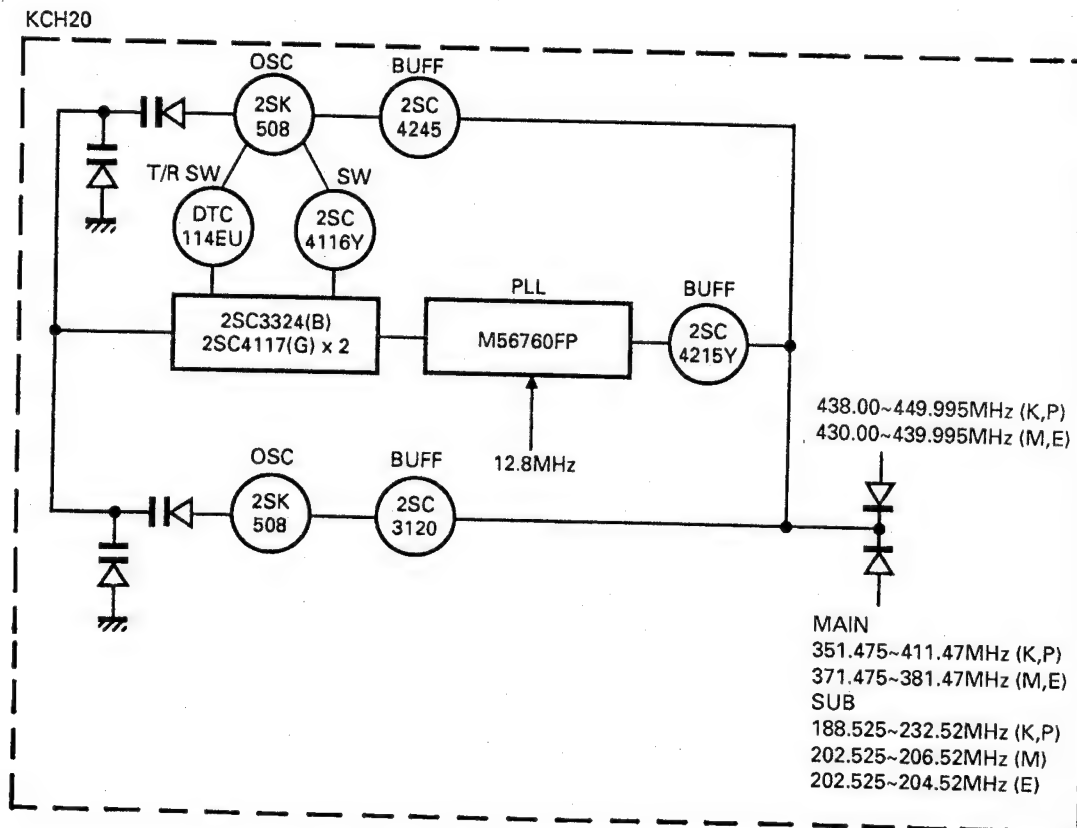

Fig. 20 430MHz band PLL block diagram

DESCRIPTION OF COMPONENTS

Ref. No	Use/Function	Operation/Condition compatibility
Q214~Q218	<p>During transmission Q214, Q215, Q216 : Off Q217 and Q218 : On</p> <p>During reception Q214, Q215, Q216 : On Q217 and Q218 : Off</p>	
Q219	Squelch switch	See IC204 operation
Q220	Power switching 14R	On for V ²
Q221~Q223	Inverter	
Q224	Modulation mute	On during reception
Q228	PLL 8V ripple filter	
Q229	VCO output amplifier	
Q230	Fan switch	
Q231	Power switching between medium and low	
Q232	APC control	
Q233	Power switch	
Q234	Power switch control	
Q236	12.8MHz amplifier	
Q401	Data communication squelch switch	On for busy
Q402	9600 bps RD buffer amplifier	
Q403	DTMF signal buffer amplifier	
Q404, Q405	Beep mute	Q404 : UHF, Q405 : VHF
Q406	MIC RD buffer amplifier	
Q407, Q408	AF amplifier	Q407 : VHF, Q408 : UHF
Q409, Q410	AF mute	Q409 : VHF, Q410 : UHF
Q411, Q412	Speaker output mute	Q411 : External speaker, Q412 : Internal speaker
Q413	Back up switch	On when 7.5V or more
Q414	Reset switch	
Q415	5C switch	
Q416	MIC RD mute	
Q417	Mic mute	
Q418	1200 bps RD buffer amplifier	
Q420	Data communication inhibit transmission switch	On when high level input
Q421	Data communication transmission switch	On during data transmission
Q422	Data communication transmission switch control	On during data transmission
Q423, Q424	Electric volume buffer amplifier	Q423 : UHF, Q424 : VHF
Q425	Packet data buffer amplifier	

TM-733A/E

DESCRIPTION OF COMPONENTS

Ref. No	Use/Function	Operation/Condition compatibility
IC1	Second local oscillator, Mixer, IF amplifier, Detection, Low-frequency amplifier, Noise amplifier, Noise detector, Squelch switching	1 : First IF input, 45.05MHz 3,4 : Second local oscillator, 45.505MHz 9 : Scan control busy signal, 0V while busy 10 : Noise-detection voltage output (DC) 11 : S-meter output 12 : Detection output 14 : RD output 15 : AF output
IC3	High-frequency amplifier	U ²
IC4	Analog switch (squelch)	See circuit description
IC5	Shift register	For squelch
IC6	AF amplifier	
IC7	Multiplexer (AF output)	See circuit description
IC8	Shift register	See circuit description
IC9	PLL	
IC10	144MHz-band transmit driver	
IC11	10V AVR	
IC201	Second local oscillator, Mixer, IF amplifier, Detection, Low-frequency amplifier, Noise amplifier, noise detector, Squelch switching	1 : First IF input, 58.525MHz 3,4 : Second local oscillator, 58.07MHz 9 : Scan control busy signal, 0V while busy 10 : Noise-detection voltage output (DC) 11 : S-meter output 12 : Detection output 14 : RD output 15 : AF output
IC204	Analog switch (squelch)	See circuit description
IC205	Shift register	For squelch
IC206	Shift register	See circuit description
IC207	PLL	
IC208	10V AVR	
IC209	430MHz-band transmit driver	
IC210	APC	
IC211	8V AVR	
IC401	DTMF decoder	
IC402	DTMF encoder	
IC403	Microprocessor	See circuit description
IC404	Analog switch	See circuit description
IC405, IC406	Multiplexer	See circuit description
IC407	Electric volume	Rch : VHF band, Lch : UHF band
IC408	6V AVR	
IC409, IC410	Serial data inverter	
IC411	Analog switch	See circuit description
IC412, IC413	Low-frequency amplifier	Microphone amplifier

DESCRIPTION OF COMPONENTS

Ref. No	Use/Function	Operation/Condition compatibility
D1~D5	Vari-cap tuning	
D6	Heterodyne switch	
D7	Reference voltage	
D8	Reverse-flow prevention	
D9	Voltage correction	
D10	Heterodyne switch	Transmit/receive switch
D11	Reverse-flow prevention	
D12	APC temperature compensation	
D13, D14	Antenna selection switch	
D15, D16	Power detection	
D17	Vari-cap tuning	
D18, D19	Reverse-flow prevention	
D202	Reverse-flow prevention	
D203	IF level limiter	
D204, D205	Heterodyne switch	
D206, D207	Reverse-flow prevention	
D210	Heterodyne switch	Transmit/receive switch
D211	APC temperature compensation	
D212	Reverse-flow prevention	
D213, D214	Antenna selection switch	
D215, D216	Power detection	
D217	Reverse power connection prevention	
D401~D404	Reverse-flow prevention	
D405	Backup detection	
D406	Reset detection	
D407, D408	Reverse-flow prevention	
D409	Surge protection	
D411	Regulation

ADJUSTMENT

Measuring Equipment for Adjustment

1. Tester
Input impedance: High
2. RF valve voltmeter (RF V.M)
Input impedance: $1M\Omega$ or more, 2 pF or less
Voltage range: Full scale = 10mV to 300V
Measurable frequency range: up to 450MHz
3. Frequency counter (f. counter)
Input sensitivity: About 50mV
Measurable frequency: 450MHz or more
4. DC power supply
Voltage: Variable in the range 10 to 17V
Current: 13A or more
5. Power meter
Measurement power: 60W, 10W, 1W
Impedance: 50Ω
Measurable frequency: 450MHz
6. AF valve voltmeter (AF V.M)
Input impedance: $1M\Omega$ or more
Voltage range: Full scale = 1mV to 30V
Measurable frequency range: 50Hz to 10kHz
7. AF generator (AG)
Output frequency: 100Hz to 10kHz
Output voltage: 0.5mV to 1V
8. Line detector
Measurable frequency: 450MHz
9. Spectrum analyzer
Measurable frequency: 450MHz
10. Directional coupler
11. Oscilloscope
High sensitivity with horizontal input terminal
12. Standard signal generator (SSG)
The standard signal generator must be able to generate the 144 and 430MHz band frequencies and vary the amplitude and frequency.
Output: $0.1\mu V$ to greater than 1mV
13. Dummy load (for AF)
 8Ω , about 5W
14. Noise generator
The noise generator must be able to generate noise similar to ignition noise containing high-frequency components of 450MHz or more.
15. Sweep generator
The sweep generator must be able to sweep the 144 and 430MHz bands.
16. Tracking generator
17. Adjustment jig

Preparation

- Set the controls and switches to the positions listed below unless otherwise specified.

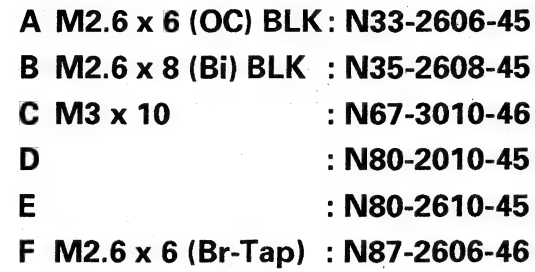

VOL control	Fully counterclockwise
SQL control	Fully counterclockwise
POWER switch	OFF
(For fixed stations)	OFF
DC power supply POWER switch	

Microphone socket
(as viewed from the front of the set)

- Use an insulated rod, such as a plastic rod, for adjustment (especially for trimmers, coils, etc.).
- To protect the signal generator, never connect the microphone to the microphone socket when the receiver section is adjusted.
- Before the power cord is connected, make sure the power switch is off.
- The SSG output level in parentheses are displayed at the release end.
Without specification of SSG, standard modulation is applied (MOD : 1kHz, DEV : $\pm 3kHz$, AF output : $0.63V/8\Omega$).
- See the instruction manual for transmit and receive operations.

ADJUSTMENT

Method of Checking the Operation of the LCD Assembly

The display microcomputer has an Assembly mode function that is useful in checking for panel display and key operation faults. The function is also helpful in investigating problems or checking operation after a repair.

When the main unit and the panel are connected together in the normal way (or by using a separate cable), the operation of the microcomputer in the main unit can also be checked.

• Entering Assembly mode

Hold down the CALL and MUTE keys and press the PWR key. All LCD segments come on and Assembly mode is entered. (See the figure below.)

If the mode fails to be entered, DC power supply power goes off, then entering assembly mode again. To exit Assembly mode, press the PWR key again or DC power supply power goes off.

• Checking operation

1. Press the VFO/M>V key. (This must always be done first.)

The serial port is automatically checked.

- If it functions normally;
"F" and "80" are displayed. (See the figure below)
- If it does not function normally;
"1" or "2" is displayed.
("1" : When SO is made low, SI does not go low.)
("2" : When SO is made high, SI does not go high.)

2. Press the BAND SEL key. (Press the AF VOL control.)
"8d" and the function indicator appear.
(The left green LED lights.)
"8E" and the function indicator appear.
(The right green LED lights.)

3. Press the CONT SEL key.
"8A" and the function indicator appear.
4. Press the PM key.
"8b" and the "1" to "6" key indicators appear.
5. Press the MHz key.
"82" and the function indicator appear.
6. Press the CALL key.
"5" and "83" appear dimly. (Minimum intensity)
7. Press the LOW key.
"4" and "89" appear. (Intensity level 4: Dim)
8. Press the SHIFT (BELL) key.
"3" and "85" appear. (Intensity level 3: Slightly dim)
9. Press the TONE key.
"2" and "86" appear. (Intensity level 2)
10. Press the REV key.
"1" and "87" appear. (Intensity level 1: Strongest)
11. Press the MUTE key.
"222222" and "22" appear.
12. Press the F key.

Each time the F key is pressed, the 6 key function display changes in three levels.

13. Set the AF and SQL-VRs to minimum, then press the MR/M key.

"00" appears on the UHF-band frequency display and "00" appears on the memory channel display.

- When the tuning knob (encoder) is turned, the number changes in the range 00 to 15.
- When the AF VOL(V) control is turned, the VHF S meter changes.
- When the AF VOL(U) control is turned, the UHF S meter changes.
- When the SQ VOL(V) control is turned, the VHF MR channel display changes in the range 00 to 63.
- When the SQ VOL(U) control is turned, the UHF MR channel display changes in the range 00 to 63.

ADJUSTMENT

TM-733A/E SCHEMATIC DIAGRAM

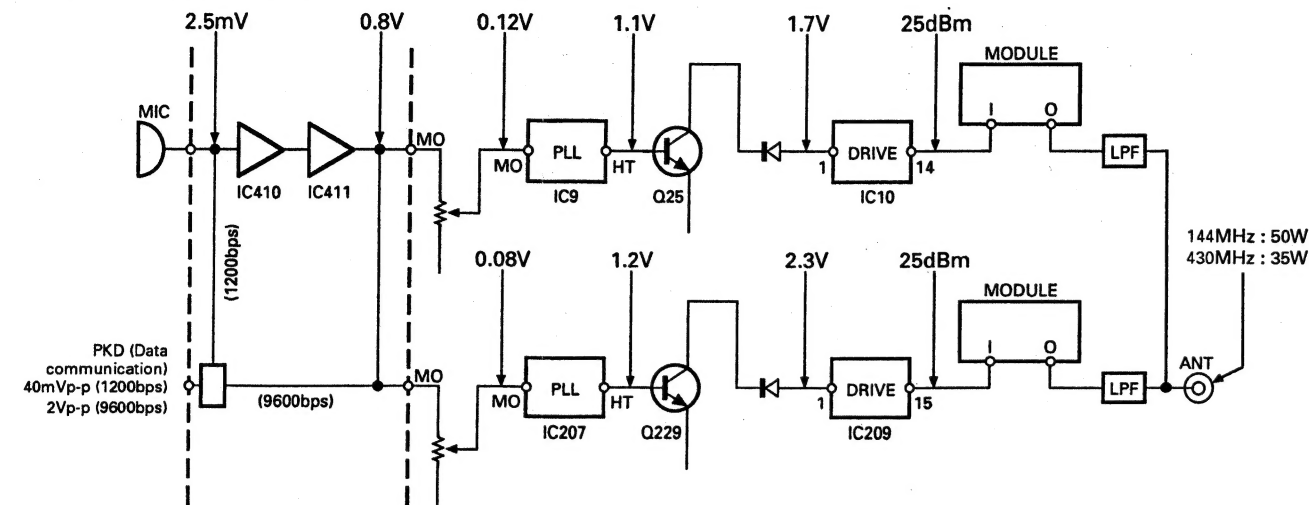

BLOCK DIAGRAM

LEVEL DIAGRAM

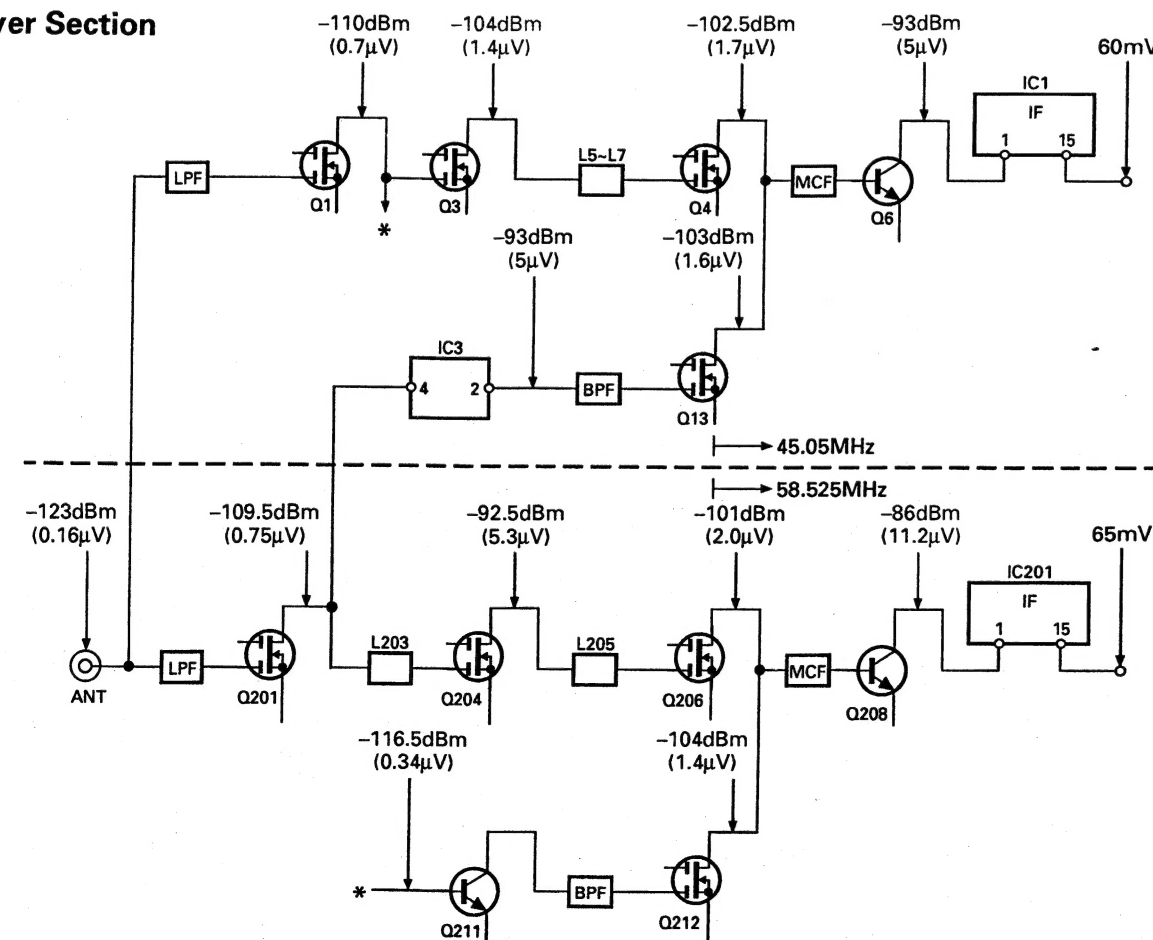

Transmitter Section

Note 1: Set the AG so that the microphone socket input is 3kHz deviation at 1kHz modulation.
The data communication connector input level is 3kHz deviation at 1kHz modulation for 1200bps and 2kHz deviation at 1kHz modulation for 9600bps.

Note 2: The transmit frequency is 145.0 or 435.0MHz.
Note 3: The HI/MID/LOW switch is set to HI.
Note 4: The measurements with the power meter, except for the ANT connector, are the values with the APC off.
Note 5: The voltages are RMS values unless otherwise specified.

Receiver Section

Note 1: The 12dB SINAD levels were plotted using a standard signal generator through a 0.01μF ceramic capacitor at each point from the RF to the first IF.

Note 2: The AF levels were measured with an AF voltmeter when the -73dBm (50μV) standard signal generator signal modulated by a 1kHz modulation frequency and a 3kHz deviation was received and the AF output was adjusted to 0.63V/8Ω by the AF VR.

TERMINAL FUNCTION

CN No.	Pin No.	Name	Function	CN No.	Pin No.	Name	Function
CN1	1	E	GND.	CN402	1	BAT	Backup power supply input.
	2	AOI	Internal speaker audio signal input.		2	SCV	VHF-band squelch busy control input.
	3	AOO	External speaker audio signal input.		3	SMV	VHF-band S-meter signal input.
	4	AGCV	AGC voltage output.		4	RDV	VHF-band de-modulation signal input.
	5	ESV1	VHF-band shift register enable (IC8).		5	RAV	VHF-band audio signal input.
	6	SB	Switched +B input.		6	MO	Modulation signal output.
	7	ESV2	VHF-band shift register enable (IC5).		7	TO	Sub-tone modulation signal output.
	8	5C	Common 5V.		8	EPV	VHF-band PLL enable input.
	9	CKV	VHF-band clock input.		9	DTV	VHF-band data output.
	10	8C	Common 8V.		10	8C	Common 8V.
	11	DTV	VHF-band data input.		11	CKV	VHF-band clock output.
	12	EPV	VHF-band PLL enable input.		12	5C	Common 5V.
	13	TO	Sub-tone modulation input.		13	ESV2	VHF-band shift register enable (IC5).
	14	MO	Modulation signal input.		14	SB	Switched +B output.
	15	RAV	VHF-band audio signal output.		15	ESV1	VHF-band shift register enable (IC8).
	16	RDV	VHF-band de-modulation signal output.		16	AGCV	AGC voltage input.
	17	SMV	VHF-band S-meter signal output.		17	AOO	External speaker audio signal output.
	18	SCV	VHF-band squelch busy control output.		18	AOI	Internal speaker audio signal output.
	19	BAT	Backup power supply output.		19	E	GND.
CN2	1	E	GND.	CN403	1	PSI	Serial data input.
	2	SP	Speaker output.		2	PSO	Serial data output.
	1	PC2	VHF-band APC output.		3	E	GND.
	2	8TV	VHF-band 8T output.		4	B	13.8V.
	3	12.8M	12.8MHz output.	CN404	1	CK	CTCSS clock output.
	4	E	GND.		2	DT	CTCSS data output.
	5	VxV	V ² output.		3	CTE	CTCSS enable output.
CN3	1	PC2	VHF-band APC input.		4	TO	Not used.
	2	8TV	VHF-band 8T input.		5	SDO	CTCSS tone matched signal input.
	3	12.8M	12.8MHz input.		6	E	GND.
	4	E	GND.		7	5C	Common 5V.
	5	VxV	V ² input.		8	RD	CTCSS de-modulation signal output.
	6	E	GND.	CN601	1	SQV	VHF-band squelch output.
	7	UxU	U ² input.		2	VOLV	VHF-band volume output.
CN201	1	FAN2	SB input for fan.		3	BSV	VHF-band band select switch output.
	2	FAN1	Fan GND.		4	VCC	5V.
CN202	1	PC2	VHF-band APC input.		5	GND	GND.
	2	8TV	VHF-band 8T input.	CN602	1	SQU	UHF-band squelch output.
	3	12.8M	12.8MHz input.		2	VOLU	UHF-band volume output.
	4	E	GND.		3	BSU	UHF-band band select switch output.
	5	VxV	V ² input.		4	VCC	5V.
CN203	6	E	GND.		5	GND	GND.
	7	UxU	U ² output.	CN603	1	MHz	MHz key output.
	1	E	GND.		2	GND	GND.
	2	RAU	UHF-band audio signal output.		3	A	Encoder output.
	3	RDU	UHF-band de-modulation signal output.		4	COM	GND.
	4	SMU	UHF-band S-meter signal output.		5	B	Encoder output.
	5	SCU	UHF-band squelch busy control output.	CN401	1	8C	Common 8V input.
	6	ESU2	UHF-band shift register enable input (IC205).		2	E	GND.
	7	ESU1	UHF-band shift register enable input (IC206).		3	SB	Switched +B input.
	8	EPV	UHF-band PLL enable input.		4	SB	Switched +B input.
	9	CKU	UHF-band clock input.		5	PSW	Power switch control signal output.
	10	DTU	UHF-band data input.

SPECIFICATIONS

Specifications are subject to change without notice due to development in technology.

General

		144MHz Band	430/440MHz Band
Frequency range	U.S.A. Canada	144~148MHz	438~450MHz
	General	144~148MHz	430~440MHz
	TM-733E	144~146MHz	430~440MHz
Mode		F3E (FM)	
Antenna impedance		50Ω	
Usable temperature range		-20°C~+60°C (-4°F~140°F)	
Power supply		13.8V DC ±15% (11.7~15.8V)	
Grounding method		Negative ground	
Current	Transmit (max.)	11.5A or less	10.0A or less
	Receive (no signal)	1.2A or less	
Frequency stability		Within ±10ppm	
Dimensions (W x H x D projections included)		141 x 42 x 165mm	
Weight		5.55" x 1.65" x 6.50"	
		1.1kg/2.4lb	

Transmitter

Power output	High	50W	35W
	Mid	10W	
	Low	Approx. 5W	
Modulation		Reactance	
Spurious emissions		-60dB or less	

	144MHz Band	430/440MHz Band
Maximum frequency deviation	±5kHz	
Audio distortion (at 60% modulation)	3% or less	
Microphone impedance	600Ω	

Receive

Circuitry	Double conversion superheterodyne	
Intermediate frequency (1st/2nd)	45.05MHz /455kHz	58.525MHz /455kHz
Sensitivity (12dB SINAD)	V or U band	0.16μV or less
	V ² or U ² band	0.25μV or less
Selectivity (-6dB)	12kHz or more	
Selectivity (-60dB)	28kHz or less	
Squelch sensitivity	0.1μV or less	
Audio output (8Ω, 5% distortion)	2W or higher	
Audio output impedance	8Ω	

Note : Receiver specifications apply only when using the V or U band. They do not apply to the V² or U² band.
